Remote Hosted Mufids – Dicecloud

DiceCloud is our answer to a remote hosted, WEB- based Multi-user Flight Information and Display System (MUFIDS). DiceCloud provides flight information systems to small and medium sized Airports via a remote WEB site.

The concept of Dice Cloud is to provide complete WEB software solutions with built in 24/7 system maintenance and customer support, without the complications and expense of having on-site servers and data interfaces. All that is required from the Airport is a good solid Internet connection, display monitors and a PC running Windows Explorer 7 ® or higher. The system license is per Airport, allowing additional displays at no extra cost. This gives the Airport freedom to install their preferred PC's and displays.

The system is provided as a rental and charged on a monthly basis. We will provide the WEB display templates and our unique WEB browser, licensed for each Airport. This browser will remove all header and tool boxes associated with standard browsers, and a simple config file will allow you configure the X and Y position parameters of each display running on the PC.

Several of the browsers may run simultaneously, allowing a single PC to drive multiple displays. Another unique function is the browser will look for the primary server service and If not found, it will automatically connect to a secondary server. This ensures you have continuity of service.

Flight information can be entered directly into the system via Airline schedules, updates being handled by local Airline employees. Or alternatively, if available at your Airport, direct Airline interfacing via our remote server is available, providing the complete daily schedule with fully automated updates. This service is provided with the rental package

If these are not available, we are able to obtain third party flight information for your Airport. This information is supplied at an additional monthly cost, and will still provide a daily schedule with automatic updates.

Where ever possible we try to provide the direct Airline interface data, at no extra charge.

With the supplied package, are standard WEB templates for operation of FIDS

- Workstation input and system configuration
- Dedicated Airline input workstation
- Visual paging creation and edit
- Image file upload and display editor
- Administrator Fids control

Optional Standard Display Templates

- Public arrival and departures
- Staff arrival and departures
- Ticket desk display
- Gate display
- Baggage claim display
- Visual paging/Advertisements

The templates provided are licensed each Airport, therefore you may use and connect as many displays as required within the Airport. The only consideration is the amount of data bandwidth that you will occupy. For example, templates showing lots of pictures and possible videos could cause a considerable reduction in bandwidth. If this exceeds the maximum limit, an extra data bandwidth charge will apply.

For example: Normal a small to medium Airport with:

- 30 arrival/departures
- 6 ticket counters
- 4 bag claim
- 6 Airline input workstations

This will not exceed the band width standard limit.

With the supplied package will we monitor your system remote on a 24/7 basis. Providing Email and SMS reporting on Display or data feed failure. Your onsite staff will also receive these reports and will be able to act on any failures. The report also offers a 24 hour health check that all is ok.

We do recommend that a separate PC is connected to your local system that provides backed up daily flight information for when the Internet fails. The display browsers in your system will fall over to the temporary PC to supply local FIDS while the Internet is down.

A firewall device is recommended with any installed system.

Pricing for small to medium Airports.

Dicefids.net WEB software suit, remote server rental with license for remote access. Module i.e. complete with Direct interface to Airport operational Airlines. Full software and system remote maintenance 24/7 With help desk, telephone and remote access support. \$ 1,385.00 per Month

Web browser template standard Arrivals/Departure \$ included

(Optional)

Web browser template standard Baggage Claim \$ 115.00 per Month
